

RFID module with keyboard for opening a cash drawer using a chip

Do your employees log in to the POS workplace using an RFID keyfob? If so, our technical solution for opening a cash drawer is offered directly with the same key!

The cash drawer opens when the RFID chip is attached (or after typing of the security combination of digits in case the worker does not have a keyring within range). Opening with a chip is faster than with a key - and there can be registered much more of the chip keys into the system than just two physical keys supplied with a cash drawer.
